Assessment Guidelines

18.02.2019 - Helena Lingor

new messages

Dear everybody,

I hope you enjoyed the first weeks of the semester holidays and could relax a bit from the annoyances of learning new stuff (;D). Nevertheless, as you know, the semester isn't really over until you have delivered your final project.

We spoke about what is expected from you at lengths in class, but of course it is necessary to have a black-and-white, written version, to which you can always refer to.

So you will find another document in the "General_Informationen"-folder here on myStudy, titled assessment_guidelines_TB2.pdf including all necessary info.

If you have any further questions don't hesitate to email me.

Don't be irritated to also find the assessment guidelines from last semester (assessment_guidelines_TB1.pdf). I uploaded those as well, because they contain still relevant infos and I didn't want to repeat myself.

Also, I encourage you to make an appointment for a video-consultation if you have any doubts regarding the final implementation of your initial concept.

Best greetings, Helena

Transistor circuit from last session

09.01.2019 - Helena Lingor

new messages

Hello everybody,

After you left I discovered the reason why for majority of people the circuit didn't work. It was the wrong transistor! The package was mixed and we didn't check every single one that we put on your boards. Everything worked out fine in the second stream after we double-checked this part.

So don't break your head any longer regarding this. Your circuit was - apart the wrong version of one component - most probably perfectly fine. Next session we will double-check the transistors and I'm sure everything will work out fine.

Best greetings,
Helena.

Home work

21.10.2018 - Helena Lingor

new messages

Dear everybody,

I want to remind you of your home work. Please try to build a database reproducing the entity relation model of the RRMORPG to be found on page 2 of the SQL chapter.

Use Python wrapped around SQL to do so, as employed in the Python script provided in the SQL folder.

Since it's quite an extensive ERM it would be a very laborious task.

So please take just the three entities "account", "character" and "region". Also use only max 3 attribute types. Nevertheless please also model the relations between these entities.

We will have a look at this task at the beginning of next session.

If you have any further questions, don't hesitate to hit me up on Slack.

Best greetings, Helena
